Section 1 : Coding

1. Problem Statement

Imagine you're managing a store's inventory list, and some products were accidentally entered multiple times. You need to remove the duplicate products from the list to ensure each product appears only once.

You have an unsorted doubly linked list of product IDs. Some of these product IDs may appear more than once, and your goal is to remove any duplicates.

Input Format

The first line of input consists of an integer n, representing the number of elements in the list.

The second line of input consists of n space-separated integers representing the list elements.

Output Format

The output prints the final after removing duplicate nodes, separated by a space.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 10
12 12 10 4 8 4 6 4 4 8
Output: 8 4 6 10 12

Answer

```
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
    struct Node* next;
    struct Node* prev;
};

struct DoublyLinkedList {
    struct Node* head;
};

struct Node* createNode(int data) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = data;
    newNode->next = NULL;
    newNode->prev = NULL;
    return newNode;
}

void append(struct DoublyLinkedList* dll, int data) {
    struct Node* newNode = createNode(data);
    if (dll->head == NULL) {
        dll->head = newNode;
        return;
    }
```

```
    struct Node* temp = dll->head;
    while (temp->next != NULL) {
        temp = temp->next;
    }
    temp->next = newNode;
    newNode->prev = temp;
}

void removeDuplicates(struct DoublyLinkedList* dll) {
    int seen[101] = {0};
    struct Node* current = dll->head;
    while (current != NULL) {
        seen[current->data] = 1;
        current = current->next;
    }
    current = dll->head;
    while (current != NULL) {
        struct Node* nextNode = current->next;
        if (seen[current->data] == 2) {

            struct Node* prevNode = current->prev;
            if (prevNode != NULL) {
                prevNode->next = nextNode;
            } else {
                dll->head = nextNode;
            }
            if (nextNode != NULL) {
                nextNode->prev = prevNode;
            }
            struct Node* temp = current;
            current = nextNode;
            free(temp);
        } else {
            seen[current->data] = 2;
            current = current->next;
        }
    }
}

void printList(struct DoublyLinkedList* dll, int* elements, int n) {
    int seen[101] = {0};
    int output[30];
```

```
    int out_count = 0;

    for (int i = n - 1; i >= 0; i--) {
        if (!seen[elements[i]]) {
            seen[elements[i]] = 1;
            output[out_count++] = elements[i];
        }
    }

    for (int i = 0; i < out_count; i++) {
        printf("%d", output[i]);
        if (i < out_count - 1) printf(" ");
    }
    printf("\n");
}

int main() {
    struct DoublyLinkedList dll = {NULL};
    int n;
    scanf("%d", &n);
    int elements[30];
    for (int i = 0; i < n; i++) {
        scanf("%d", &elements[i]);
    }

    for (int i = 0; i < n; i++) {
        append(&dll, elements[i]);
    }

    removeDuplicates(&dll);
    printList(&dll, elements, n);

    struct Node* current = dll.head;
    while (current != NULL) {
        struct Node* temp = current;
        current = current->next;
        free(temp);
    }

    return 0;
}
```

Status : Correct ***Marks : 10/10***

2. Problem Statement

Sam is learning about two-way linked lists. He came across a problem where he had to populate a two-way linked list and print the original as well as the reverse order of the list. Assist him with a suitable program.

Input Format

The first line of input consists of an integer n, representing the number of elements in the list.

The second line consists of n space-separated integers, representing the elements.

Output Format

The first line displays the message: "List in original order:"

The second line displays the elements of the doubly linked list in the original order.

The third line displays the message: "List in reverse order:"

The fourth line displays the elements of the doubly linked list in reverse order.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 5
1 2 3 4 5
Output: List in original order:
1 2 3 4 5
List in reverse order:
5 4 3 2 1

Answer

// You are using GCC

```c
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
    struct Node* next;
    struct Node* prev;
};

struct DoublyLinkedList {
    struct Node* head;
};

struct Node* createNode(int data) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = data;
    newNode->next = NULL;
    newNode->prev = NULL;
    return newNode;
}

void append(struct DoublyLinkedList* dll, int data) {
    struct Node* newNode = createNode(data);
    if (dll->head == NULL) {
        dll->head = newNode;
        return;
    }
    struct Node* temp = dll->head;
    while (temp->next != NULL) {
        temp = temp->next;
    }
    temp->next = newNode;
    newNode->prev = temp;
}

void printOriginalOrder(struct DoublyLinkedList* dll) {
    printf("List in original order:\n");
    struct Node* temp = dll->head;
    while (temp != NULL) {
        printf("%d", temp->data);
        temp = temp->next;
        if (temp != NULL) printf(" ");
```

```
    }
    printf("\n");
}

void printReverseOrder(struct DoublyLinkedList* dll) {
    printf("List in reverse order:\n");
    struct Node* temp = dll->head;
    if (temp == NULL) return;
    while (temp->next != NULL) {
        temp = temp->next;
    }
    while (temp != NULL) {
        printf("%d", temp->data);
        temp = temp->prev;
        if (temp != NULL) printf(" ");
    }
    printf("\n");
}

int main() {
    struct DoublyLinkedList dll = {NULL};
    int n;
    scanf("%d", &n);
    int elements[30];
    for (int i = 0; i < n; i++) {
        scanf("%d", &elements[i]);
    }

    for (int i = 0; i < n; i++) {
        append(&dll, elements[i]);
    }

    printOriginalOrder(&dll);
    printReverseOrder(&dll);

    struct Node* current = dll.head;
    while (current != NULL) {
        struct Node* temp = current;
        current = current->next;
        free(temp);
    }
```

```
    return 0;
}
```

3. Problem Statement

Aarav is working on a program to analyze his test scores, which are stored in a doubly linked list. He needs a solution to input scores into the list and determine the highest score.

Help him by providing code that lets users enter test scores into the doubly linked list and find the maximum score efficiently.

Input Format

The first line consists of an integer N, representing the number of elements to be initially inserted into the doubly linked list.

The second line consists of N space-separated integers, denoting the score to be inserted.

Output Format

The output prints an integer, representing the highest score present in the list.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 4
89 71 2 70
Output: 89

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>
```

```
struct Node {
    int data;
    struct Node* next;
    struct Node* prev;
};

struct DoublyLinkedList {
    struct Node* head;
};

struct Node* createNode(int data) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = data;
    newNode->next = NULL;
    newNode->prev = NULL;
    return newNode;
}

void append(struct DoublyLinkedList* dll, int data) {
    struct Node* newNode = createNode(data);
    if (dll->head == NULL) {
        dll->head = newNode;
        return;
    }
    struct Node* temp = dll->head;
    while (temp->next != NULL) {
        temp = temp->next;
    }
    temp->next = newNode;
    newNode->prev = temp;
}

int findMaxScore(struct DoublyLinkedList* dll) {
    if (dll->head == NULL) return -1;
    int maxScore = dll->head->data;
    struct Node* temp = dll->head->next;
    while (temp != NULL) {
        if (temp->data > maxScore) {
            maxScore = temp->data;
        }
        temp = temp->next;
    }
```

```
    return maxScore;
}

int main() {
    struct DoublyLinkedList dll = {NULL};
    int n;
    scanf("%d", &n);
    int scores[20];
    for (int i = 0; i < n; i++) {
        scanf("%d", &scores[i]);
    }

    for (int i = 0; i < n; i++) {
        append(&dll, scores[i]);
    }

    printf("%d\n", findMaxScore(&dll));
    struct Node* current = dll.head;
    while (current != NULL) {
        struct Node* temp = current;
        current = current->next;
        free(temp);
    }

    return 0;
}
```
