Section 1: Coding

1. Problem Statement

Marie, the teacher, wants her students to implement the ascending order of numbers while also exploring the concept of prime numbers.

Students need to write a program that sorts an array of integers using the merge sort algorithm while counting and returning the number of prime integers in the array. Help them to complete the program.

Input Format

The first line of input consists of an integer N, representing the number of array elements.

The second line consists of N space-separated integers, representing the array elements.

Output Format

The first line of output prints the sorted array of integers in ascending order.

The second line prints the number of prime integers in the array.

Refer to the sample output for formatting specifications.

```
Sample Test Case
```

```
Input: 7
   5368974
   Output: Sorted array: 3 4 5 6 7 8 9
   Number of prime integers: 3
   Answer
   #include <stdio.h>
   #include <stdlib.h>
   int is_prime(int n) {
     if (n < 2) return 0;
     for (int i = 2; i * i <= n; i++) {
        if (n \% i == 0) return 0;
     return 1;
   void merge(int arr[], int left, int mid, int right) {
     int n1 = mid - left + 1;
     int n2 = right - mid;
     int *L = (int *)malloc(n1 * sizeof(int));
     int *R = (int *)malloc(n2 * sizeof(int));
     for (int i = 0; i < n1; i++)
        L[i] = arr[left + i];
     for (int j = 0; j < n2; j++)
       R[j] = arr[mid + 1 + j];
int i = 0, j = 0, k = left;
```

```
240707475
                                                     240707475
  while (i < n1 \&\& j < n2) {
    if (L[i] <= R[j]) {
       arr[k] = L[i];
       i++;
     } else {
       arr[k] = R[j];
       j++;
     k++;
  }
  while (i < n1) {
     arr[k] = L[i];
                        240707475
    √j++;
  while (j < n2) {
     arr[k] = R[j];
     j++;
     k++;
  }
  free(L);
  free(R);
                                                      240707475
void merge_sort(int arr[], int left, int right) {
  if (left < right) {
     int mid = left + (right - left) / 2;
     merge_sort(arr, left, mid);
     merge_sort(arr, mid + 1, right);
     merge(arr, left, mid, right);
  }
}
int main() {
  int n;
  scanf("%d", &n);
                                                                                   240707475
                                                      240707475
// Input array
  int arr[10];
```

```
for (int i = 0; i < n; i++) {
           scanf("%d", &arr[i]);
        int temp[10];
        for (int i = 0; i < n; i++) {
           temp[i] = arr[i];
        merge_sort(arr, 0, n - 1);
if (is_prime(temp[i])) {
    prime_count++:
    }
        printf("Sorted array: ");
        for (int i = 0; i < n; i++) {
           printf("%d", arr[i]);
           if (i < n - 1) printf(" ");
        printf("\n");
        printf("Number of prime integers: %d\n", prime_count);
return 0;
                                                                                    Marks: 10/10
      Status: Correct
```

2. Problem Statement

Aryan is participating in a coding competition where he needs to sort a list of numbers using an efficient sorting algorithm. He decides to use Merge Sort, a divide-and-conquer algorithm, to achieve this. Given a list of n elements, Aryan must implement merge sort to arrange the numbers in ascending order.

Help Aryan by implementing the merge sort algorithm to correctly sort the given list of numbers.

Input Format

The first line of input contains an integer n, the number of elements in the list.

The second line contains n space-separated integers representing the elements of the list.

Output Format

The output prints the sorted list of numbers in ascending order, separated by a space.

Refer to the sample output for formatting specifications.

Sample Test Case

```
Input: 5
80 40 20 50 30
```

Output: 20 30 40 50 80

```
Answer
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

void merge(int arr[], int left, int mid, int right) {
   int n1 = mid - left + 1;
   int n2 = right - mid;

   int *L = (int *)malloc(n1 * sizeof(int));
   int *R = (int *)malloc(n2 * sizeof(int));

   for (int i = 0; i < n1; i++)
        L[i] = arr[left + i];
   for (int j = 0; j < n2; j++)
        R[j] = arr[mid + 1 + j];

   int i = 0, j = 0, k = left;</pre>
```

```
240707475
         while (i < n1 && j < n2) {
           if (L[i] <= R[j]) {
              arr[k++] = L[i++];
            } else {
               arr[k++] = R[i++];
           }
         }
         while (i < n1) {
            arr[k++] = L[i++];
         while (j < n2) {
           arr[k++] = R[j++];
         free(L);
         free(R);
       }
       void merge_sort(int arr[], int left, int right) {
         if (left < right) {</pre>
            int mid = left + (right - left) / 2;
            merge_sort(arr, left, mid);
           merge_sort(arr, mid + 1, right);
            merge(arr, left, mid, right);
       int main() {
         int n;
         scanf("%d", &n);
_, (Int i = 0; i < n; i++)
scanf("%d", &arr[i]);
         for (int i = 0; i < n; i++) {
                                                                                               240707475
```

```
merge_sort(arr, 0, n - 1);

for (int i = 0; i < n; i++) {
    printf("%d", arr[i]);
    if (i < n - 1) printf(" ");
}
printf("\n");

return 0;
}</pre>
```

Status: Correct Marks: 10/10

3. Problem Statement

Ravi is given an array of integers and is tasked with sorting it uniquely. He needs to sort the elements in such a way that the elements at odd positions are in descending order, and the elements at even positions are in ascending order.

Your task is to help Ravi create a program that uses insertion sort to sort the array as per the specified conditions and then print the sorted array. Position starts from 1.

Example

Input:

Size of the array = 10

Array elements = 25 36 96 58 74 14 35 15 75 95

Output:

Resultant array = 96 14 75 15 74 36 35 58 25 95

Explanation:

Initial Array: 25 36 96 58 74 14 35 15 75 95

Elements at odd positions (1, 3, 5, 7, 9): 25 96 74 35 75

Elements at odd positions sorted descending order: 96 75 74 35 25

Elements at even positions (2, 4, 6, 8, 10): 36 58 14 15 95

Elements at even positions sorted ascending order: 14 15 36 58 95

So, the final array is 96 14 75 15 74 36 35 58 25 95.

Input Format

The first line contains an integer N, representing the number of elements in the array.

The second line contains N space-separated integers, representing the elements of the array.

Output Format

The output displays integers, representing the sorted array elements separated by a space.

Refer to the sample output for formatting specifications.

Sample Test Case

```
Input: 4
3 1 4 2
Output: 4 1 3 2

Answer

#include <stdio.h>

void insertion_sort_odd(int arr[], int n) {
    for (int i = 0; i < n; i += 2) {
        int key = arr[i];
        int j = i - 2;
        while (j >= 0 && arr[j] < key) {
            arr[j + 2] = arr[j];
            j -= 2;
        }
        arr[j + 2] = key;
    }
</pre>
```
